PRESENTATION SLIDE:

EVENT MANAGEMENT & TICKET BOOKING SYSTEM

Using MongoDB Backend

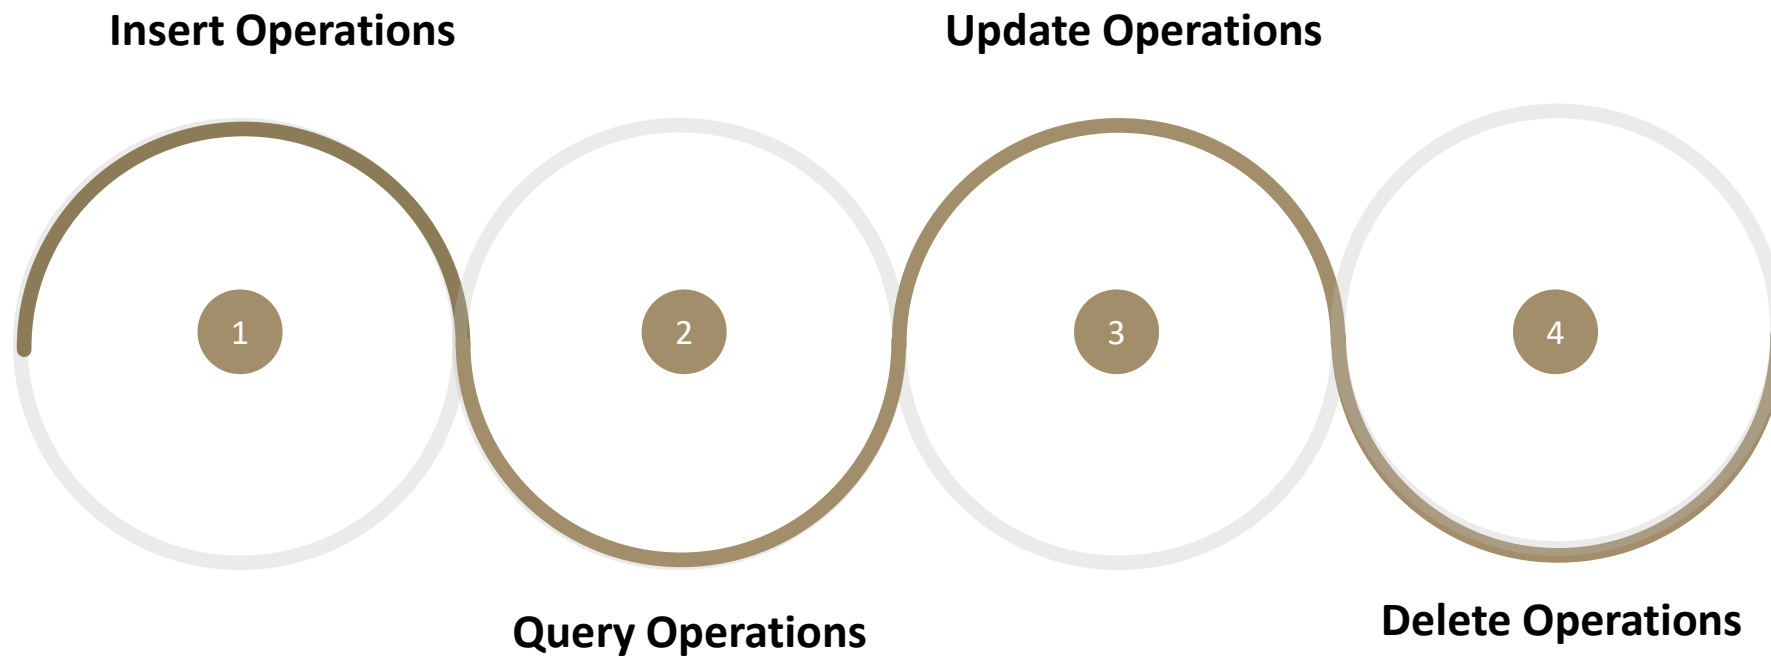

Innovating Solutions

www.utm.my

Case Study Introduction

This project implements a NoSQL environment for the Event Management and Ticket Booking System using MongoDB. The system is used to manage users, events, ticket bookings, and users reviews. It supports operations such as registering new users, creating new events, booking tickets, and submitting feedback.

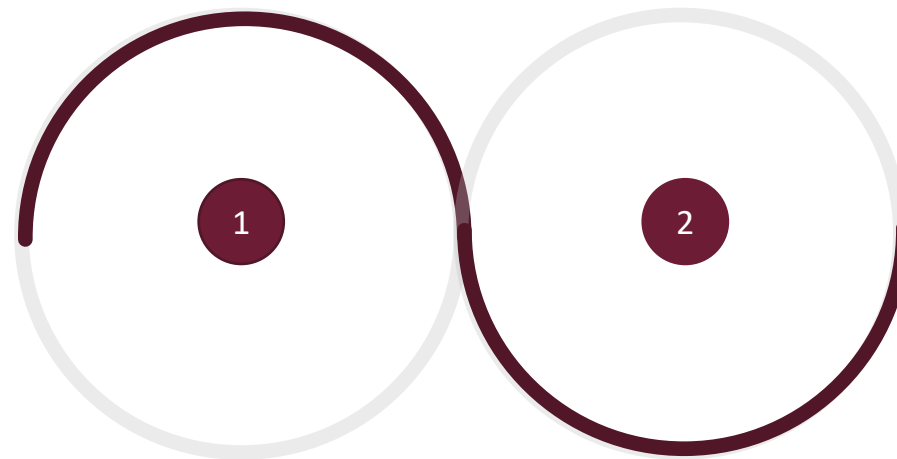

Basic MongoDB Operations (CRUD) demonstration:

This will be shown using MongoDB

Advanced MongoDB Operations :

Indexing

Aggregation Pipelines

This will be shown using MongoDB

Team roles

Team Member	Role
Joanne Ching Yin Xuan	- Designed reviews collections schema - Perform CRUD operations in collections. - Perform aggregation and sorting operations in collections - Conclude what was learned, challenges, and recommendations for improvement - Justification of modifications
Chua Jia Lin	- Designed user collections schema - Perform CRUD operations in collections. - Perform aggregation operation in collections - Analyzed the effect of indexing towards query performance - Contributed to the Introduction and Teamwork of the project

Team roles

Team Member	Role
Evelyn Goh Yuan Qi	- Designed bookings collections schema - Perform CRU operations in collections - Perform indexing and aggregation operations in collections - Analyzed and documented the challenges encountered during database development. - Explained the security considerations and system limitations of the database design.
Lim Yu Han	- Designed events collections schema - Perform CRU operations in collections. - Implement bulk update operations to modify documents efficiently. - Demonstrated sorting operations to organize event records logically. - Contributed to the NoSQL data model explanation and documented query logic in the report.
